Environmental Problems in Propriá - SE: Sewage in the São Francisco River

A notable environmental problem in the city of Propriá, in Sergipe, is the constant dumping of sewage into the São Francisco River. This problem is serious, because it is with the water of this river that the entire region of Baixo São Francisco is supplied, and many people who visit the city of Propriá take advantage of the visit to dive in the waters of this river, especially during the river's flood period, but these people take the risk of becoming infected with diseases because of the waste that was present in the sewage that is dumped into the river.

And one of the ways to solve this problem would be with the sewage going through a treatment process, in which the sewage will go through a purification process and that, in the end, will be returned to the river, or will be used as reuse water in several areas of the economy, as in the generation of energy, in industrial processes, cleaning of streets and squares.
